**ABSTRACT**

A tray table that facilitates consumption of entertainment  
and various other media via a portable electronic device is  
disclosed herein. The tray table includes a panel that secures  
the portable electronic device for hands free operation. One  
or more channels at the panel receive at least a portion of the  
portable electronic device. The panel is capable of rotating  
between an open and closed position, while the tray table  
itself may rotate between a stowed and service position.

## TRAY TABLE AND METHOD THEREFOR

## CROSS-REFERENCE TO RELATED APPLICATION

This application is a continuation of U.S. patent application Ser. No. 14/878,075, filed Oct. 8, 2015, which is a continuation of U.S. patent application Ser. No. 14/479,888, filed Sep. 8, 2014, which is a continuation of U.S. patent application Ser. No. 13/314,161, filed Dec. 7, 2011, which claims priority to U.S. Provisional Patent Application No. 61/546,969, filed Oct. 13, 2011.

## BACKGROUND OF THE INVENTION

## 1. Field of the Invention

The invention relates to seatback tray tables and in particular to a tray table with a rotatable panel for electronic devices.

## 2. Related Art

Airplane tray tables have been largely unchanged for decades. In general, such tray tables move between a stowed upright position and a service position where a tray table is generally horizontal so that items may be supported by the tray table. In the service position, the tray table may be used to support food, drink, and other items for a passenger.

Attempts have been made to update traditional tray tables. For example, U.S. Patent Publication No. 2011/0126739 discloses a portable collapsible tray table apparatus configured to provide an elevated platform upon which a user's electronic device may be supported. For instance, the tray table apparatus may support the user's laptop at an elevated position. The elevated platform may also include a removable section that can be removed to reveal an electronic device holder for holding a user's electronic device.

As another example, U.S. Pat. No. 7,500,716 discloses a multi-function tray table having a slidable portion and an internal stationary portion. The slidable portion extends towards a passenger during use while the stationary portion does not. The stationary portion and the sliding portion are required parts of an elaborate mechanism configured to ensure that an entertainment device of the tray table is viewable when the tray table is stowed.

From the discussion that follows, it will become apparent that the present invention addresses the deficiencies associated with the prior art while providing numerous additional advantages and benefits not contemplated or possible with prior art constructions.

## SUMMARY OF THE INVENTION

An improved tray table that facilitates consumption of in-flight entertainment (IFE) or other media is disclosed herein. Various embodiments of an improved tray table and methods therefor are disclosed herein. For instance, in one exemplary embodiment, a method for improving a tray table to secure a portable electronic device at a passenger seat is disclosed, with such method comprising identifying a tray table to improve, providing a panel having a first side, a second side and one or more protruding portions extending outward from the first side, and forming a channel in each of the protruding portions, the channel dimensioned to receive at least a portion of the portable electronic device.

This method also includes providing one or more rotatable mounts, attaching a first portion of the rotatable mounts to the panel, and affixing a second portion of the rotatable mounts to a body of the tray table. The second portion is

fixed in position relative to the body while the first portion is rotatable relative to the body.

In another exemplary embodiment a method for improving a tray table to secure a portable electronic device at a passenger seat is disclosed, with such method comprising identifying a tray table, providing a panel having one or more channels attached thereto, the channels dimensioned to receive at least a portion of the portable electronic device, and providing one or more rotatable mounts.

This method also includes attaching a first portion of the rotatable mounts to the panel, and affixing a second portion of the rotatable mounts to a body of the tray table. The second portion is fixed in position relative to the body while the first portion is rotatable relative to the body.

In another exemplary embodiment, a tray table for securing a portable electronic device at a passenger seat is disclosed with such tray table comprising a planar body, a panel rotatably attached to the planar body by one or more rotatable mounts, and one or more channels formed in one or more protruding portions of the panel. The channels are dimensioned to receive at least a portion of the portable electronic device. One or more mounting points at which the planar body is attached to the passenger seat are also provided.

Other systems, methods, features and advantages of the invention will be or will become apparent to one with skill in the art upon examination of the following figures and detailed description. It is intended that all such additional systems, methods, features and advantages be included within this description, be within the scope of the invention, and be protected by the accompanying claims.

## BRIEF DESCRIPTION OF THE DRAWINGS

The components in the figures are not necessarily to scale, emphasis instead being placed upon illustrating the principles of the invention. In the figures, like reference numerals designate corresponding parts throughout the different views.

FIG. 1A is a perspective view of an exemplary tray table in a stowed position;

FIG. 1B is a perspective view of an exemplary tray table in a service position with inter-tray in a closed position;

FIG. 1C is a perspective view of an exemplary tray table in an open service position;

FIG. 1D is a perspective view of an exemplary tray table in a service position;

FIG. 1E is a perspective view showing removal of an electronic device from an exemplary tray table;

FIG. 2A is a perspective view of an exemplary tray table and panel;

FIG. 2B is a perspective view of an exemplary tray table and panel;

FIG. 2C is a perspective view of an exemplary tray table and external connection ports;

FIG. 2D is a bottom perspective view of an exemplary tray table showing weep holes;

FIG. 2E is a perspective view of an exemplary tray table and panel;

FIG. 3A is a perspective view of a battery of an exemplary tray table;

FIG. 3B is a perspective view of a battery of an exemplary tray table in an extending position;

FIG. 3C is a perspective interior layout view an exemplary tray table;

FIG. 3D is a block diagram illustrating an exemplary tray table;

3

FIG. 4 is a block diagram illustrating an exemplary in-flight entertainment system;

FIG. 5A is a perspective view of an exemplary headrest mounted electronic display;

FIG. 5B is a perspective view of an exemplary headrest mounted electronic display in a pivoted position; and

FIG. 5C is a perspective view of an exemplary headrest mounted panel.

#### DETAILED DESCRIPTION OF THE INVENTION

In the following description, numerous specific details are set forth in order to provide a more thorough description of the present invention. It will be apparent, however, to one skilled in the art, that the present invention may be practiced without these specific details. In other instances, well-known features have not been described in detail so as not to obscure the invention.

The tray table herein enhances the utility of a tray table by providing IFE capabilities, while lowering weight and maintenance costs which will reduce fuel costs and carbon emissions. Though described herein with reference in an airplane environment, it is noted that the tray table may be used in various vehicles, such as busses, cars, limousines, trains, and other vehicles. In addition, the tray table may be used in other settings such as waiting rooms, Internet kiosks, and the like.

As will be described further below, the tray table also saves in fuel costs because of the weight savings achieved by its open and lightweight structure. In addition, the electronic components of the tray table are easily serviceable and have the significant advantage in that they do not require any additional wiring. This is highly advantageous in that it avoids the weight of such wiring; the cost of the installation of such wiring, downtime to install the wiring, as well as certification of an aircraft after such wiring has been installed.

The tray table includes electronic elements for IFE. This is an advantage in that it eliminates the need to have inflight magazines, brochures, safety manuals and the like on board. This saves weight and thus saves fuel. In addition, maintenance crews no longer need to spend time replacing old or worn inflight materials ordinarily stored in seat pockets or overhead bins (or elsewhere on an aircraft). On top of this, the printing and distribution costs for such materials are eliminated.

The electronic elements of the tray table also create a more enjoyable passenger experience. As will be described further below, the tray table may be interactive and may be used to present various media, including music, games, and videos, and other digital content to keep passengers entertained. In addition, passengers may use the tray table to communicate with flight crews or others via text, audio, video, and the like. Typically, this interactivity, communication, and media capability will be provided via an electronic device with one or more display screens that may be provided with and/or coupled or docked to the tray table.

The tray table will now be described with regard to FIGS. 1A-1E. FIGS. 1A-1E provide various views of the tray table 104. As can be seen, the environment of use shown is an aircraft passenger seat 128, though the tray table 104 may be used in a variety of vehicles and seats. The tray table 104 may have a stowed position, such as shown in FIG. 1A, and a service position, such as shown in FIGS. 1B-1C. As can be seen, in the service position, the tray table 104 may be deployed for use as a horizontal support surface (for food,

4

drink, etc.), while allowing its electronic device 108 to be used if desired. It is noted that the electronic device 108 may also be used in the stowed position. For example, a user may view advertisements and interact with the electronic device 108 in the stowed position (as well as in the service position) via a display 136 of the electronic device. As will be described further below, the electronic device 108 may be held in or dock with a panel 124 of the tray table 104, which may power or charge an electronic device 108 through an external port via a battery charger cable.

The tray table 104 may be movably attached to a passenger seat 128. In the embodiments shown for example, the tray table 104 is attached to the passenger seat 128 with pivoting arms 116 that allow the tray table to be moved between the stowed and service positions. The tray table 104 may be movably attached to a passenger seat 128 (or other seat or structure) in this and other ways, such as with hinges, pivots, and the like.

As can be seen, in the stowed position (shown by FIG. 1A), the electronic device 108 is positioned such that its display 136 is visible to a passenger through an opening 112 of the tray table 104. In this manner, the passenger can view various media even when the tray table 104 is stowed. For example, one or more advertisements may be presented to the passenger in the stowed position. These advertisements may be presented during boarding, taxiing, takeoff, landing, and cruising altitude for example. Other media or IFE services/materials may be provided as well, such as books, magazines, music, and video. For example, after the aircraft has reached a particular altitude (such as a cruising altitude), this media may be accessible to the passenger. Advertising may still be provided if desired.

In the service position (shown by FIG. 1B), the tray table 104 may be used in a manner similar to a traditional tray table. As can be seen, the back of the panel 124 may provide a planar surface that spans the opening 112 in the tray table 104. In this manner, a continuous surface can be provided to support food, drink, or other items. As will be described further below, the panel may rotate to conceal and reveal the electronic device 108 it holds.

The opening 112 in the tray table 104 is beneficial in that it results in a weight savings since there is no material at that portion of the tray table 104. In addition, the panel 124 does not utilize complex and heavy components to accomplish its rotation or movement, as will be described further below. This also helps ensure that the tray table 104 has a low overall weight despite having a wide range of media and interactive capabilities.

Referring to FIG. 1C, operation of the panel 124 can be seen. As shown for instance, the panel 124 may rotate within the opening 112 of the tray table 104. In FIG. 1C for instance, the panel 124 has been tilted back (towards the passenger seat 128) to reveal the electronic device 108 held by the panel. This is an open position of the panel 124. As can be seen, the display 136 of the electronic device 108 is held at a comfortable viewing position for the passenger in the open position.

The panel 124 may be rotatably mounted to the body 120 of the tray table 104. In this manner, the panel 124 can be moved from a closed position (such as shown in FIG. 1B) to an open position and vice versa. In some embodiments, the pivot or rotating mount may allow the panel 124 to rotate a full 360 degrees. For example positioning the rotating mount at a midpoint of the panel 124 would permit the panel to rotate 360 degrees within the opening.

In other embodiments, a reduced angle of rotation may be provided. One or more stops may be provided to fix the

panel 124 at an open or closed position or at various other angles. For example, the panel 124 may rotate from a closed position (at 0 degrees), to an open position less than 180 degrees. In another example embodiment, the panel may rotate to a maximum of 130 or 140 degrees. The stops may physically hold or block rotation of the panel at the maximum angle or at various angles in between. This allows a passenger to position the panel 124 (and the electronic device 108 held therein) at a desired viewing angle. The stops may be disengaged to move the panel 124 to other positions. It is noted that the rotating mount holding the panel 124 may utilize a friction hold to hold the panel 124 at whatever angle the passenger moves the panel to.

In some embodiments, the rotation of the panel 124 may be stopped by physical contact with a portion of the tray table 104. For instance, as shown in FIG. 1C, the back of the panel 124 is in contact with a back section of the tray table 104 thereby stopping the panel's backward rotation and holding the panel (and electronic device 108) in that open position.

Referring to FIG. 1D, it can be seen that the panel 124 may allow the electronic device 108 to be removed so that a passenger may hold the electronic device in his or her hands during use. This is advantageous in that it causes the electronic device 108 to not be a permanent fixture of the aircraft, while increasing the convenience to passengers. It is noted that the tray table 104 may be configured to inductively or otherwise wirelessly charge the electronic device 108 in some embodiments. Therefore, the electronic device 108 may be charged or powered by placing it on or near the tray table 104, or in the panel 124.

The electronic device 108 may be installed or removed in various ways as will be described below. For instance, FIG. 1E illustrates that the electronic device 108 may be installed or removed by sliding it into or out of the panel 124.

It is contemplated that the electronic device 108 and/or tray table 104 may have an alerting mechanism (such as one or more speakers, lights, or the like) to indicate unauthorized use of the electronic device. For example, one or more lights, alarms, sirens or other audiovisual alerts may be emitted during unauthorized use. To illustrate, an alert may be emitted when the electronic device 108 is not in the panel 124 during takeoff or landing or at other times when the flight crew restricts use of the electronic device outside the panel. This also prevents theft in that an alert will be emitted if the electronic device 108 is not within the panel 124 during landing. It is noted that the flight crew may be alerted as well, such as via a pager, tablet, or other electronic device possessed by members of the flight crew.

The flight crew may activate or deactivate the alarm mechanism, or the alarm mechanism may automatically activate or deactivate such as when the aircraft is at or within a particular altitude or range of altitudes. A tray table 104 may have its own altimeter for these purposes or may receive altitude from an aircraft altimeter either through a wired or wireless connection. As an additional theft or unauthorized use preventer, the electronic device 108 may also or alternatively be labeled with a warning label cited consequences and/or rules and regulations governing the tampering with or theft of aircraft fixtures.

The panel 124 may have one or more switches, contacts, sensors, or the like to determine whether the electronic device 108 is within the panel. In addition, the tray table 104 may have a lock in some embodiments to prevent it from being moved from the stowed position to the service position. This feature may also be used to prevent theft of the electronic device 108.

Further details regarding the tray table 104 will now be described with regard to FIGS. 2A-2C. As can be seen, the tray table 104 may comprise a body 120 having an opening 112 where the panel 124 is rotatably mounted. The opening 112 may have one or more mounting structures to hold the panel 124. For example, one or more mounts may be at the side walls or sides of the opening. The mounts may engage the panel 124 to rotatably secure the panel. The mounts may be various structures. For example, the mounts may be pins, axels, pivots, hinges or the like. In one or more embodiments, a mount may be located at both sides of the opening 112 to provide the rotation of the panel 124 as shown in the figures.

The opening 112 may be at various locations of the body 120. For instance, as shown in FIG. 2A the opening 112 is centrally located. This centers the panel 124 and electronic device. It is contemplated that the opening 112 could be at the sides or closer to the sides of the body 120 in some embodiments.

One or more mounts 220 may be attached to the body 120. This allows the body 120 and thus the entire tray table 104 to be attached to a passenger seat 128. For example, referring to FIG. 1B, it can be seen that the mounts 220 may connect one or more supports 116 to the tray table 104 to secure the tray table. The mounts 220 may be configured to allow the body 120 to rotate. Similar mounts or pivots, axels, pins or the like may be used to rotatably mount the panel 124 to the tray table 104.

As stated, the panel 124 is generally configured to support or hold the electronic device 108. This may be accomplished in various ways. For instance, as shown in FIG. 2A, the panel 124 may comprise one or more channels 204 that accept a portion of the electronic device 108. In FIG. 2A, it can be seen that the channels 204 accept an outer peripheral portion of the electronic device 108 to hold the electronic device. The channels 204 may have a "U" shaped cross section to accept a peripheral portion of the electronic device 108, such as shown. Channels 204 may be located at the sides as well as the bottom of the panel 124 (as shown in FIG. 2A).

In some embodiments, channels 204 may only be at the sides of the panel 124. The channels 204 may extend around the electronic device 108 to various extents. For example, as seen in FIG. 2E, the channels 204 extend a further distance along the length of the left and right sides of the electronic device 108.

The channels 204 may be configured to allow the electronic device 108 to be removable. For example, the channels 204 have an open portion 224 where the electronic device 108 may be inserted into (as well as removed from) the channels 204. In this manner the electronic device 108 may be removed by pulling it out of the channels 204 and may be inserted by sliding or moving the electronic device into the channels at the open portion 224 of the channels.

It is noted that the channels 204 or a portion thereof may be curved or angled along their length such as to better secure the electronic device 108 therein. Alternatively or in addition, the channels 204 may provide a snug fit relative to the peripheral portion of the electronic device 108 that is inserted into the channels. In this manner the electronic device 108 can still be removed but is less likely to accidentally come out or fall out of the panel 124. In addition, since fasteners are not required (but may be used if desired), the panel 124 has a reduced weight while removably securing the electronic device 108.

In some embodiments, channels 204 may have one or more openings 236 (e.g., weep holes) therein. In the event a

liquid is spilled, the openings will allow such liquid to escape the channels 204 to prevent the channels from “flooding”. The channels 204 can then dry and/or be cleaned. Exemplary openings 236 are illustrated in FIGS. 2B and 2D.

It is noted that the electronic device 108 may be removably secured to the panel 124 in various ways. For example, the electronic device 108 and panel 124 may comprise coupling or mating fasteners, which releasably hold the electronic device to the panel. Alternatively or in addition, the electronic device 108 may be removably secured to the panel 124 by a friction fit or magnets.

The panel 124 may also have a back section 228. As described above with regard to FIG. 1B, the back section 228 or section of the panel 124 may form a planar surface that spans the opening 112 of the tray table 104 to provide a continuous support surface when the tray table is in the service position (and the panel is in a closed position).

FIG. 2B illustrates top angled view of the tray table 104, with the electronic device 108 removed. The concave shape (e.g., “U” shaped cross section) of the channels 204 that accepts the electronic device 108 can be seen in this view.

Also it can be seen from FIG. 2B that the panel 124 may have one or more interfaces or ports 208 that provides an electrical or other connection to the electronic device 108. As will be described further below, this is advantageous in that data and/or power may be transferred to/from the electronic device 108 via this port 208. Thus the flight crew or airline need not worry about charging the electronic device 108 directly, since the electronic device can be charged by the tray table 104 itself. It is noted that a connection with the port 208 may be used to determine if the electronic device 108 is within the panel 124 for theft or unauthorized use detection as described above.

The port 208 may be positioned such that it automatically connects with the electronic device 108 when the electronic device is stored in the panel 124. As shown for example, the port 208 is located at a bottom portion of the panel 124 where it can automatically connect to a corresponding connector of the electronic device when the electronic device is inserted.

Referring to FIG. 2C, the tray table 104 may also provide one or more other ports or connectors 212, 216. For example, audio, USB, power, data, and other connections could be provided via these connectors 212, 216. Typically, these connectors 212, 216 will be configured to allow passenger devices, such as laptops, smart phones, tables, headphones, and the like to be connected. For instance, as shown in FIG. 2C, an audio jack 216 and USB port 212 are provided at the side of the tray table’s body 120 where they are accessible to a passenger even when the panel 124 is closed. It is noted that audio media and data could be accessed/shared from the electronic device 108 via these connectors 212, 216 when the panel 124 is both closed and opened.

It is noted that the panel 124 may be held in a closed position by a latch 244 in some embodiments. The latch 244 may utilize a mechanical structure to hold the panel 124 closed. When actuated or otherwise manipulated the latch 244 may release the panel 124 allowing it to rotate to an open position. In some embodiments, the latch 244 may utilize a friction fit or magnets, which hold the panel 124, closed which can be overcome by the user to rotate the panel to an open position.

The panel 124 may also protect the electronic device 108 in some embodiments. For instance, as shown in FIG. 2E (which shows the electronic device 108 partially removed from the panel 124), the panel 124 may provide a cover 240

to enclose and/or protect the electronic device 108. The cover 240 may be transparent to allow the screen 136 of the electronic display 108 to remain visible. The cover 240 may be a rugged and/or resilient material to resist shattering or breaking. Should the screen 136 shatter or break, the cover 240 will contain the screen within the panel 124. In addition, the cover 240 may prevent damage to the screen 136 caused by physical impacts. It is contemplated that the electronic device 108 may be positioned adjacent the cover 240 such that touch screen input is operational through the cover.

In addition to the weight savings described above, the tray table 104 saves a great deal of additional weight by eliminating the need for wiring. In traditional IFE systems, an aircraft must either be built with wiring to support (e.g., power) the IFE system at each seat or must be retrofitted with such wiring. This wiring adds significant weight to the aircraft and requires inspection and certification. In the case of a retrofit, adding wiring is an extremely complex operation and requires an aircraft to be removed from service for a substantial amount of time.

In contrast, the tray table 104 has its own power source in the form of an internal removable battery, as shown in FIGS. 3A-3C. This battery 304 provides power to the electronic device to power and/or recharge the electronic device. Since the battery 304 is part of the tray table 104, there is no need to rewire or wire an aircraft to support the tray table. It is contemplated however that, if desired, the tray table 104 may be connected to aircraft power systems to receive power to its electronic device 108 though this would eliminate some of the weight savings provided by the tray table.

It is also contemplated that the electronic device 108 may be charged in various other ways via the tray table 104. For example, the tray table 104 may charge an electronic device 108 via induction in one or more embodiments. Alternatively or in addition, the tray table 104 (or the electronic device 108) may have one or more solar panels for charging purposes or to power the electronic device. Other power sources may be used as well. For example, devices that generate electricity from temperature differences (e.g., thermoelectric generators) or vibration (e.g., kinetic energy electrical generators) may be used in addition to or instead of a battery 304.

Referring to FIGS. 3A-3B, it can be seen that the battery 304 may have one or more power level indicators 308, such as lights, LCD displays, and the like. These indicators 308 inform flight or maintenance crews of how much power is remaining in the battery 304. When low, the battery 304 can be easily removed for recharging and/or replacement. For example, as FIG. 3B shows, the battery 304 can be ejected or otherwise removed from the tray table 104 quite easily.

This is advantageous in that flight crews can readily view the power level of the battery 304 and change batteries as necessary. For example, during cleaning after an aircraft has landed, any low batteries 304 may be quickly and easily identified and replaced. It is contemplated that the removed batteries 304 may be placed in a charger and recharged for subsequent usage. A charger having multiple slots or receptacles to accept multiple batteries may be used to accomplish recharging. In addition, such charger may be handheld or portable to function as a carrier. In this manner, low batteries 304 can be removed from each seat and placed into the charger. The charger can then be moved to a charging area on (or off) the aircraft to charge the low batteries in bulk.

Typically, a battery 304 will be locked into the tray table 104 to prevent passengers from removing the battery. Thus, in one or more embodiments, a release mechanism 312 may be provided to prevent unauthorized removable while allow-

ing authorized removable of batteries **304** to be quick and easy. The release mechanism **312** may accept one or more keys or other unlocking devices/tools to operate. The battery locking mechanism may be configured to automatically lock a battery in the body **120** of the tray table **104** to speed the battery replacement process.

FIG. 3C provides an internal view of the tray table **104**. As can be seen, the top half of the tray table **104** has not been illustrated to show an exemplary internal layout. As can be seen, a compartment **316** may be formed in the body **120** of the tray table **104** to accept the battery **304**. This compartment **316** may be externally accessible (e.g., open to the outside) so that the battery **304** can be removed. One or more leads or conductors **320** may provide a conduit for power to travel from the battery **304** to the electronic device. As can be seen, a rotating mount **324**, pivot, or hinge of the panel **124** may allow the conductors **320** to electrically connect to the electronic device, such as via a port of the panel (while securing the panel **124** to the tray table **104**).

In some embodiments, the battery compartment **316** may be in or attached to the panel **124**. In such embodiments, the battery **304** may be removable as described above. One or more conductors **320** may connect the battery **304** to the electronic device. In such case, since the battery **304** is supported by the panel **124**, the conductors **320** need not bend or twist when the panel is rotated.

It is contemplated that a switch may be provided in one or more embodiments to automatically connect or disconnect the battery **304** from the electronic device. For instance, when the panel **124** is in a closed position (such as in FIG. 1B), the switch may disconnect the battery **304** to prevent battery drain. When the panel **124** is in an open position (such as in FIG. 1C) the switch may reconnect the battery **304** to the electronic device. The switch may be a mechanical device that connects and disconnects the battery **304** when the panel **124** is moved from a closed position to an open position. Alternatively one or more sensors may determine the position of the panel **124** and connect/disconnect the battery **304** appropriately.

FIG. 3D is a block diagram illustrating the components of an exemplary tray table **104**. In general, these components will be held within the body **120** of the tray table. As can be seen, in one or more embodiments, the tray table **104** may comprise a controller **328**, which may be configured to control operation of the tray table **104** and its various components to provide the functionality disclosed herein. For example, among other things, the controller **328** may be configured to charge an electronic device **108** via a port **208**, detect power levels of the tray table's battery **304**, indicate the power level of the battery via an indicator **308**, and/or detect the presence or absence of the electronic device within the panel via a sensor **340**.

The controller **328** may be a microprocessor, integrated circuit, or other circuit. The controller **328** may be hard wired to provide the functionality disclosed herein and/or may execute machine-readable code to provide the same. In some embodiments, this machine-readable code may be stored on a memory of the controller itself or a separate memory device **332**. The memory device **332** may be used to store other information as well, such as configuration settings, various media (such as for IFE or safety presentation purposes), and the like. The memory device **332** may be optional and thus not provided in all embodiments.

As can be seen, the tray table **104** may also include one or more accessory devices **336**. For example, a credit card reader, RFID reader, Bluetooth™ transceiver, and/or currency acceptor could be provided such as to allow passen-

gers to make payments for IFE services at the tray table **104**. In one embodiment for example, a passenger could swipe a credit card, insert coins, bills or other currency, or pay wirelessly via a RFID, Bluetooth or other wireless receiver or transceiver. It is noted that the Bluetooth or other wireless transceiver may also or alternatively be used to share data with other devices, such as wireless headsets, smart phones, laptops or the like.

FIG. 3D also illustrates a connection between a tray table **104** and the aircraft. This connection is optional and thus is not provided in all embodiments. When provided, such connection may provide electrical power and/or data to the tray table **104** either by a wired or wireless connection. If wireless power is desired, such power may be provided by induction chargers located at each passenger seat. For example, when the tray table **104** is in close proximity to the passenger seat, such as when stowed, the tray table's battery may be charged by an induction charger. Power and/or data from the aircraft can be shared with the electronic device **108** via the tray table's port **208**.

FIG. 4 is a block diagram illustrating an exemplary in-flight entertainment system having tray tables. As can be seen, a server **404** may be provided to supply media and other data to the tray tables **104**. The server **404** and electronic devices **108** of the tray tables **104** may communicate data via one or more communication links that will typically be wireless. Books, magazines, advertisements, video, photos, audio, web pages, and other data may be provided by the server **404** in this manner.

In addition, input from passengers collected by the electronic devices **108** may be transmitted to the server **404** as well. This permits interactivity with the server **404**. For instance, passengers may order media, such as movies, songs, news or other articles from the server **404** by providing input at the electronic device **108** at their seats. Since the server **404** may be onboard the aircraft, media distribution is efficient because the electronic devices **108** do not need to communicate with a ground based server. It is contemplated that passengers may also or alternatively communicate with flight crews via the electronic devices **108** and/or server **404**. The flight crew may have their own electronic device to receive and respond to such communication. For example, text messages, audio, or video could be communicated between passengers and the flight crew via the electronic devices **108** such as to order food or request assistance. This is beneficial because the flight crew need not move up and down the aircraft aisles to communicate with passengers.

In one or more embodiments, the electronic devices **108** may be portable computing devices. An electronic device **108** may have a display **136** such as described above to present information or media visually to a passenger. The display **136** may be an LCD, electronic paper, OLED, or other display technology capable of presenting various still images or video. The display **136** may have a touch sensor to detect user input at the display. In addition or alternatively one or more other inputs such as buttons, switches, knobs, and the like may be provided to capture user input. The electronic device **108** may also have audio inputs and/or outputs to provide a multimedia experience. As stated above, a passenger may utilize headphones to enjoy such an experience.

It is contemplated that the display **136** may have a one or more protective coverings, such as to prevent it or a portion of it from shattering upon impact. For example, the screen of the display **136** may have a protective film to contain any shards or pieces of the display should it be damaged.

## 11

The electronic device **108** may also have one or more communication devices, such as wired or wireless network interfaces. A communication device may be used to communicate media or other data with external devices, such as other electronic devices **108**, passenger devices (e.g., smart phones, PDAs, laptops, tablets), the IFE server **404**, etc . . . A communication device may also be a data port, such as a USB port or the like for communicating data with flash drives, human interface devices, and other peripherals.

The electronic device **108** may comprise one or more processors and have its own storage device. The processor may execute instructions such as in the form of machine-readable code to provide the media playback and interactive functions of the electronic device described herein. For example, the processor may run an operating system that allows various applications to execute thereon to provide IFE functionality. The machine-readable code or instructions may be retrievably stored on the storage device and/or hardwired into the processor itself.

In one or more embodiments, the electronic device **108** may have particular restrictions programmed therein. For example, certain features may be enabled or disabled at certain times. To illustrate, during boarding, taxiing, takeoff and/or landing only advertising may be displayed by the electronic device **108**. Once at a predefined altitude (e.g., 10,000 ft), full functionality of the electronic device **108** may be restored. The enabling or disabling of features may be triggered by an external occurrence. For example, the server **404** (controlled by the flight crew) may instruct an electronic device **108** to enable or disable certain features or to disable itself completely. This allows the flight crew to override passenger input at the electronic devices, such as to present safety presentations and/or advertising.

The tray table or features thereof may be implemented in various ways. For instance, FIGS. **5A-5C** illustrate an embodiment having an electronic device **108** at a headrest portion of the passenger seat **128**. The panel **124** in this embodiment is configured to accept the electronic device **108** and hold the electronic device at the headrest portion of the passenger seat **128**. A release **504** may be provided to eject or otherwise release the electronic device **108** from the panel **124**. The release **504** may be a click-release mechanism to allow passengers to remove the electronic device **108**. It is noted that the release **504** may be automatically disabled at certain times, such as during takeoff and landing to prevent unauthorized use or theft.

As can be seen from FIG. **5B**, the panel **124** may allow the electronic device **108** to pivot to provide a better viewing angle for a passenger. In addition, as shown in FIG. **5C**, the panel **124** may allow the electronic device **108** to be completely removed for handheld use.

The features described above with regard to the tray table may be provided in a headrest-mounted embodiment. For example, the panel **124** or the passenger seat **128** itself may house one or more removable batteries to provide power to the electronic device **108**. In addition or alternatively, the passenger seat **128** may be wired to the aircraft power system to provide power to the electronic device **108**.

In addition, one or more sensors, switches, ports, or the like may be used to detect the presence or absence of the electronic device **108** within the panel, such as described above. If the electronic device **108** is not within the docking station **124** at particular times, an alert may be generated. As stated above, this feature is useful in preventing theft and unauthorized use.

It is contemplated that in some embodiments the electronic device **108** need not be stored in a panel **124**. For

## 12

instance, the electronic device **108** could be stored in a seat pocket of the passenger seat **128** similar to a magazine or safety pamphlet. In such embodiments, one or more sensors, switches, ports, or the like may be used to determine the presence or absence of the electronic device **108** within the seat pocket to prevent theft or unauthorized use. It is noted that the panel **124** could be provided within the seat pocket or replace the seat pocket in some embodiments.

Alternatively or in addition, a charging cable may be provided so that the electronic device **108** may be connected to a battery **304** of the panel **124** or at the passenger seat **128**. The charging cable could also be used to transfer power from the aircraft's wiring to the electronic device **108** such as in embodiments where power is wired to the passenger seats **128**. Once connected to the charging cable, the electronic device **108** may be stored in a seat pocket or panel.

While various embodiments of the invention have been described, it will be apparent to those of ordinary skill in the art that many more embodiments and implementations are possible that are within the scope of this invention. In addition, the various features, elements, and embodiments described herein may be claimed or combined in any combination or arrangement.

What is claimed is:

1. A method for holding a portable electronic device at a tray table comprising:
  - providing a panel having a first side, a second side and one or more channels at the first side,
  - the one or more channels dimensioned to receive at least a portion of the portable electronic device;
  - providing one or more rotatable mounts;
  - attaching a first portion of the one or more rotatable mounts to the panel; and
  - affixing a second portion of the one or more rotatable mounts to a body of the tray table, wherein the second portion is fixed in position relative to the body while the first portion is rotatable relative to the body.
2. A method for holding a portable electronic device at a passenger seat comprising:
  - identifying a tray table;
  - providing a panel having one or more channels attached thereto, the one or more channels dimensioned to receive at least a portion of the portable electronic device;
  - providing one or more rotatable mounts;
  - attaching a first portion of the one or more rotatable mounts to the panel; and
  - affixing a second portion of the one or more rotatable mounts to a body of the tray table, wherein the second portion is fixed in position relative to the body while the first portion is rotatable relative to the body.
3. A tray table for securing a portable electronic device at a passenger seat comprising:
  - a planar body;
  - a panel rotatably attached to the planar body by one or more rotatable mounts;
  - one or more channels at at least one side of the panel, the one or more channels dimensioned to receive at least a portion of the portable electronic device; and
  - one or more mounting points at which the planar body is attached to the passenger seat.
